POLYESTER POWDER COAT

Powder coating is an efficient method to apply a hard wearing, weatherproof surface finish to our cast iron and ductile iron products. The process works by applying a free flowing polyester powder, using an electrostatic gun. The items then pass through an oven to bake the powder to form a hard surface. Most RAL & BS colours are available.

Polyester Powder Coat has the following benefits:

- Gives additional corrosion protection to the galvanized castings.
- Excellent colour stability.
- High durability and resistance to weathering.

*Colours shown above are our standard colours, other colours are available on request.
